Brain Memory

Give AI coding assistants a **long-term memory**

brain-memory
Pre-release · Private Beta

Brain Memory is a **developer tools plugin** that gives AI coding assistants **persistent, human-like memory** across sessions — so they remember your projects, decisions, and preferences **forever**.

The Problem

- ✕ AI coding assistants forget everything when you start a new session
- ✕ Developers waste time re-explaining context, past decisions, and preferences
- ✕ No existing solution is local, transparent, or truly intelligent about what to remember

The Opportunity

- → AI-assisted coding is a $40B+ market growing 25%+ annually
- → Memory is the #1 requested feature by power users of Claude, Copilot, and Cursor
- → First mover in the "AI agent memory layer" category

What We Do

Remember

The AI stores decisions, learnings, and context as simple Markdown files organized in a meaningful folder structure.

Connect

Memories automatically link together. Recalling one idea surfaces related knowledge — just like the human brain.

Evolve

A "sleep cycle" strengthens important memories, merges duplicates, and lets irrelevant ones fade — keeping the brain sharp.

Why We're Different

	Traditional Approaches	Brain Memory
Storage	Cloud databases, vector stores	**Local Markdown files — readable by humans**
Infrastructure	Servers, APIs, embeddings	**Zero dependencies — just your file system**
Privacy	Data leaves your machine	**100% local, never leaves your device**

	Traditional Approaches	Brain Memory
Intelligence	Simple keyword search	**Neuroscience-inspired: decay, association, reinforcement**
Maintenance	Manual cleanup required	**Self-organizing: strengthens, merges, and prunes automatically**
Compatibility	Locked to one tool	**Works with Claude, Gemini, and Codex CLI**

Market

30M+
developers using AI coding assistants today

$40B+
AI developer tools market (2025, growing 25%+ YoY)

#1
most requested feature: "remember my preferences"

Current Stage

- Working product, pre-release stage
- One-command install (npm release planned)
- 10 slash commands with full lifecycle management
- Supports 3 major AI agent platforms
- Neuroscience-grounded scoring (11 published concepts)

Business Model Potential

- **Freemium:** Free core + premium features
- **Team sync:** Shared team memories across projects
- **Enterprise:** Org-wide knowledge retention layer
- **Platform play:** Memory-as-a-Service API for AI agents
- **Integrations:** IDE plugins, cloud backup, analytics

Let's Talk

Building the memory layer for the AI-native developer workflow.
